Webinar on Impact of Climate Change on Agriculture

held on
28th October
2020

Organized by

Department of Agronomy
College of Agriculture
Navsari Agricultural University
Campus Bharuch - 392012

Agriculture is not only sensitive to climate change but also one of the major drivers for climate change. Understanding the weather changes over a period of time and adjusting the management practices towards achieving better harvest are challenges to the growth of agricultural sector as a whole. The climate sensitivity of agriculture is uncertain, as there is regional variation in rainfall, temperature, crops and cropping systems, soils and management practices. The inter-annual variations in temperature and precipitation were much higher than the predicted changes in temperature and precipitation. The crop losses may increase if the predicted climate change increases the climate variability. All these emerging uncertainties due to climate change have found to aggravate the problems of future food security within the country. Despite putting numerous efforts to mitigate the effects of climate change, India has failed in responding sufficiently in dealing the issue of climate change. Thus, it is imperative to come up with more effective adaptation and mitigation strategies in order to combat the effects of climate change.
